

### DESCRIPTION

The GLF72520 / GLF72524 Load Switch is a fully integrated 4 A NMOS load switch with I<sub>Q</sub>Smart™ advanced technology. The device is targeted for the mobile computing and data storage markets as a high performance, low cost solution for load switch applications.

The GLF72520 / GLF72524 has a constant low on-resistance of 10 mΩ at room temperature and a supply current consumption of less than 100 nA at lower input voltages. The fixed rise time helps prevent undesirable inrush current when turned on and the internal EN pin pulldown resistor ensures the device remains in the shutdown mode when disabled. In shutdown mode the GLF72520 / GLF72524 draws only 7 nA typical at 3.6 V input supply voltage.

The GLF72520 / GLF72524 features a reverse current blocking protection. When the GLF72520 / GLF72524 is disabled, it prevents reverse current flowing from the output to the input source.

The GLF72520 / GLF72524 is available in a wafer level chip scale package (WLCSP) measuring 0.97 mm x 1.47 mm x 0.55 mm with a 0.5 mm pitch. This allows the user to save board space and increase cost savings.

### FEATURES

- Supply Voltage Range: 0.8 V to 3.6 V
- Low R<sub>ON</sub>: 10 mΩ Typ
- I<sub>OUT</sub> Max: 4 A
- Ultra-Low I<sub>Q</sub>:
  - 60 nA Typ at 0.8 V<sub>IN</sub>
  - 65 nA Typ at 1.0 V<sub>IN</sub>
  - 70 nA Typ at 1.2 V<sub>IN</sub>
- GLF72520 V<sub>OUT</sub> Rise Time
  - 1150 us at 0.8 V<sub>IN</sub>
  - 800 us at 3.3 V<sub>IN</sub>
  - 780 us at 3.6 V<sub>IN</sub>
- GLF72524 V<sub>OUT</sub> Rise Time
  - 460 us at 0.8 V<sub>IN</sub>
  - 280 us at 3.3 V<sub>IN</sub>
  - 280 us at 3.6 V<sub>IN</sub>
- Internal EN Pull-Down Resistor
- Integrated Output Discharge Switch: GLF72524
- Reverse Current Blocking Protection When Disabled
- Operating Temperature Range: - 40 to 85 °C
- HBM: 6 kV, CDM: 2 kV
- 0.97 mm x 1.47 mm x 0.55 mm, 6 Bumps Wafer Level Chip Scale Package

## ABSOLUTE MAXIMUM RATINGS

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

## APPLICATION INFORMATION

The GLF72520 / GLF72524 is a fully integrated 4 A NMOS load switch with fixed slew rate control to limit the inrush current during turn on. Each device is capable of operating over a wide input range from 0.8 V to 3.6 V with very low on-resistance to reduce conduction loss. In the off state, these devices consume very low leakage current, avoiding unwanted standby current from the input power supply. The GLF72520 / GLF72524 is available in the 0.97 mm x 1.47 mm wafer level chip scale package with 6 bumps at 0.5 mm pitch to save space in compact applications.

### Input Capacitor

A capacitor is recommended to be placed close to the  $V_{IN}$  pin to reduce the voltage drop on the input power rail caused by transient inrush current at start-up. A higher input capacitor value can be used to further attenuate the input voltage drop.

### Output Capacitor

An output capacitor is recommended to minimize voltage undershoot on the output pin during the transition when the switch is turned off. Undershoot can be caused by parasitic inductance from board traces or intentional load inductances. If load inductances do exist, use of an output capacitor can improve output voltage stability and system reliability. The  $C_{OUT}$  capacitor should be placed close to the VOUT and GND pins.

### Reverse Current Blocking

The GLF72520 / GLF72524 has a built-in reverse current blocking protection. When the device is disabled, the reverse current blocking protection is activated to prevent the reverse current from the Vout to the Vin source.

### EN pin

The GLF72520 / GLF72524 can be activated by EN pin high. Note that the EN pin has an internal pull-down resistor to maintain a reliable status without EN signal applied from an external controller.

### Output Discharge Function

The GLF72524 has an internal discharge N-channel FET switch on the VOUT node. When EN signal turns the main power FET to an off state, the N-channel switch turns on to discharge an output capacitor quickly.

### Board Layout

All traces should be as short as possible to minimize parasitic inductance effect. Wide traces for VIN, VOUT, and GND will help reduce signal degradation and parasitic effects during dynamic operations as well as improve the thermal performance at high load current.
